

Alchemy "Lube n' Lock"

Lube n' Lock is a superior spoke thread compound designed to lubricate the spoke threads and create a locking bond between the nipple and spoke.

It differs from other thread compounds in a number of ways.

First, the compound contains a light lubricant that eliminates any galling at the nipple threads, even at extremely high tension. This allows for a smooth, trouble free build.

Second, the compound cures to a "breakable" bond. Unlike other compounds that can cause the nipple to seize on the spoke, Lube n' Lock creates a bond that is strong enough to prevent the nipple from loosening, but that still allows normal truing of the wheel.

Instructions:

- 1) Make sure that the spoke threads are clean and oil free.
- 2) Stir the compound with a small, clean screwdriver.
- 3) Put some compound on a clean, dry surface ("glossy" cardboard paper works well)
- 4) Roll the threads of each spoke through the compound until the threads are completely covered.
- 5) Build wheel.
